

Project Initialization and Planning Phase

Date	14 July 2026
Team ID	N/A (Solo Project)
Project Title	OptiCrop – Smart Agricultural Production Optimization Engine using Machine Learning
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) Report

This project recommends the most suitable crop for cultivation using machine learning. It analyzes soil nutrient values and environmental conditions to predict the optimal crop from twenty-two categories. The solution reduces reliance on guesswork, improves agricultural productivity, supports efficient resource utilization, and encourages sustainable farming practices.

Project Overview	
Objective	Develop an intelligent machine learning system that recommends the most suitable crop based on soil nutrients and environmental conditions with high accuracy.
Scope	The project includes data collection, preprocessing, feature transformation, model training, evaluation, and deployment using Flask. The Random Forest algorithm is used to identify the best-performing model for real-time crop prediction.

Problem Statement	
Description	Farmers often select crops based on tradition or intuition rather than actual soil and climatic suitability. This inconsistent, manual approach can reduce productivity, increase cultivation costs, and waste natural resources such as water and fertilizers.
Impact	A data-driven recommendation system improves decision-making speed, increases the likelihood of a successful harvest, reduces financial risk, minimizes resource waste, and promotes sustainable farming.

Proposed Solution	
Approach	Historical crop data (soil nutrients and climate values) is preprocessed and used to train a Random Forest Machine Learning model. The trained model is integrated into a Flask web application for real-time crop prediction.

Key Features	• Automated Crop Recommendation from Soil and Climate Data • High Accuracy using Random Forest Machine Learning • Real-Time Prediction through Web Application • User-Friendly, Responsive Interface • Detailed Crop Information and Farming Tips • Fast, Instant Decision-Making Process • Scalable and Modular Architecture

Resource Requirements

Resource Type	Description	Specification / Allocation
Hardware		
Computing Resources	CPU specifications, number of cores	Intel Core i3/i5 Processor (4+ Cores)
Memory	RAM specifications	4 GB RAM (Minimum), 8 GB Recommended
Storage	Disk space for datasets, trained models, and application files	500 MB Free Space (Minimum)
Software		
Frameworks	Python Web Framework	Flask
Libraries	Machine Learning and Data Processing Libraries	Scikit-learn, Pandas, NumPy, Matplotlib, Seaborn
Development Environment	IDE	Jupyter Notebook, Visual Studio Code
Data		
Data	Source, Size, Format	Crop Recommendation Dataset (Kaggle), CSV Format, 2,200 Records, 22 Crop Classes
